

Got Wireless? Just Call It X-Ray.

By Gayle North

The U.S. government allowed wireless phones to be put on the market in the 1980s with absolutely no safety testing. Today, REFLEX research demonstrates that Wi-phones blasting high-frequency microwaves are basically personal X-ray devices. ... Consumers aren't permitted to buy household X-ray machines. Yet comparably lethal wireless devices are handed out to grade school kids for heavy and indiscriminate use, with virtually no hazard warnings and no medical supervision.

The big lie. "There are no known risks from exposure to RF emissions from wireless phones...."

This disingenuous and contradictive mantra has been adopted by both the FCC and the FDA even though the telecom industry's own Wireless Technology Research (WTR) program of the '90s showed that cell phone radiation—at levels well below "safety" guidelines—causes blood-brain barrier damage, animal tumors and a 300 percent increase in DNA damage to human blood". — Amy Worthington investigative Journalist has received international acclaim for her articles on the hazards of the wireless age.

Has your cell phone become your constant companion? Research reports on the effects of electrical pollution and radiation from cell phones, transmitters, and large and small electric appliances began emerging during the 90's. Now, despite the efforts of the cell phone and electronics industries to minimize the dangers being reported by scientists around the world, the information is readily available – if you look for it.

There are two effects we need to be concerned about with cell phones. First – and the thing that ties this problem to the coaching I do, is the thermal effect. Irrefutable evidence now confirms that microwave radiation emitted by cell phones creates heat in human tissues near the device.

The thermal (heating) effect from cell phones and cordless phones may cause headaches, fatigue, tissue swelling, memory impairment, dizziness, nausea, learning difficulties, insomnia, and tingling. Insomnia, headaches, and learning difficulties are problems that people come to PCI to resolve after finding no medical cause. The use of cell and cordless phones are now another factor to consider.

But there are other potentially severe long-term damages. Research concurs that EMFs interfere with cellular DNA and its repair mechanisms. In addition, cell phone radiation makes cancerous cells grow aggressively.

Electro-Magnetic Frequency (EMF) is the measure of radiation that comes from a cell phone, cordless phone, computer, hair dryer, microwave oven, automobile electronics, or other electrical appliances. Cell phones emit the same form of radiation as microwave ovens- only in smaller dosages. While no one would ever consider sticking their heads inside a microwave oven, every time you hold a cell phone up to your ear you are bombarding your head with microwave radiation!

"EMFs are everywhere, and that's precisely the problem. According to medical researcher Robert O. Becker, M.D, "At the present time, the greatest polluting element in the earth's environment . . . more serious even than global climate change and chemical pollution . . . is the proliferation of electromagnetic fields."- Cell Phones and Cancer Only many years after the introduction of cell

phones has scientific research become sophisticated enough to find the dangerous effects of microwave radiation from cell phones and other EMF-emitting devices. If you think that your cordless phone is a safer bet, think again. Digital cordless phones emit the same dangerous microwave frequencies as cell phones or, in some cases, even higher levels, as do most headsets.”
Sherrill Stellman, ND

The evidence is overwhelming that cell phones pose a very real health risk. Fortunately, there are proven technologies that offer protection from harmful EMFs.

One of the most effective solutions is called a BioPro Chip, developed by German scientists and distributed by BioPro Technology. Their inexpensive EMF Harmonizing Chips are activated and programmed to neutralize or harmonize the range of frequencies that emanate from cell phones, cordless phones and other EMF emitting devices, converting them into harmless frequency waves. Once the chip is applied to the phone, or other device, the harmful EMF effects are effectively neutralized, making them safe to use.
